Dashboard 1: Operations & OEE Performance

This dashboard focuses on production performance and OEE analysis. It presents key operational KPIs alongside machine output, production costs, OEE trends, product distribution, monthly unit production, and shift performance comparisons. Interactive machine and shift filters allow users to analyze performance across different production periods. The dashboard is designed for production managers, manufacturing engineers, and operational analysts who need to monitor productivity, compare machine performance, and identify opportunities for process improvement. Trend charts and comparative visualizations support data-driven decision-making and continuous improvement efforts.

Dashboard 2: Operations Efficiency & Maintenance Analytics

This dashboard focuses on maintenance performance and operational efficiency across factory machines. Key metrics such as Total Cost, Average OEE, Total Downtime, and Total Units Produced are displayed prominently to provide an immediate overview of factory performance. Additional visualizations highlight maintenance outcomes, downtime causes, maintenance costs, service intervals, and technician performance. The dashboard helps maintenance supervisors and operations managers identify recurring issues, evaluate technician effectiveness, and prioritize maintenance activities. Color coding is used to distinguish high-performing assets and personnel from those requiring attention.

Target Users

Both dashboards serve factory managers, production engineers, maintenance supervisors, and operational analysts. Together, they provide a comprehensive view of manufacturing operations by combining production performance monitoring with maintenance analytics, enabling informed decisions that improve efficiency, reduce downtime, and optimize resource utilization.
